विषय :– **दीघा–कंकड़बाग सीवरेज परियोजना अंतर्गत कंकड़बाग जोन में राईजिंग मेन के कार्य हेतु NOC निर्गत करने के संबंध में।**

प्रसंग :– संवेदक का पत्रांक–255, दिनांक–30.01.2025

महाशय,

उपर्युक्त विषयक प्रासंगिक पत्र के संबंध में कहना है कि दीघा–कंकड़बाग सीवरेज परियोजना के संवेदक VA [illegible] WABAG Ltd द्वारा योजना अंतर्गत कंकड़बाग जोन में 1200 mm dia Rising Main बिछाये जाने हेतु नंद लाल छपरा रोड की ओर योगीपुर नाले पर SPS B के पास एन0एच0–30 के 103 मीटर हिस्से को Cross करने लिए पथ कटिंग का अनापत्ति प्रमाण पत्र NHAI से प्राप्त करने हेतु अनुरोध किया गया हैं।

अनापत्ति प्रमाण पत्र प्राप्त करने हेतु निम्नलिखित दस्तावेज समर्पित किया गया है:–

1. Cutting Details(NHAI Road Crossing details)
2. Licence fee calculation details
3. Prevailing circle rates
4. Draft Undertaking
5. Checklist as pere MoRTH Guidline dated-22-11-2016
6. Cross-Sectional drawing
7. Sketch Details for Trenchless for NH Crossing
8. Approved Methodology for Trenchless pipe laying by Jack pushing method
9. Utility Survey report
10. L-Section Drawing for Rising main

आपको अवगत कराना चाहते हैं कि नमामि गंगे जैसी महत्त्वाकांक्षी योजना की नियमित रूप से समीक्षा PMO तथा जल शक्ति मंत्रालय, भारत सरकार द्वारा किया जा रहा है।

उक्त के आलोक में अनुरोध है कि कंकड़बाग जोन में 1200 mm dia Rising Main बिछाये जाने हेतु नंद लाल छपरा रोड की ओर योगीपुर नाले पर SPS B के पास एन0एच0–30 के 103 मीटर हिस्से को Cross करने लिए पथ कटिंग हेतु यथाशीघ्र अनापत्ति प्रमाण–पत्र निर्गत करने की कृपा की जाय ताकि नमामि गंगे जैसी केन्द्र सरकार की महत्वाकांक्षी योजना का कार्य ससमय एवं सुगमतापूर्वक पूर्ण किया जा सके।

अनुलग्नकः–यथोक्त।

Check- List

Guidelines for processing the proposal for laying of utility line (Sewerage pipeline) in the land across National Highway vested with MoRT&H.

General Information

1	**Name and Address of the Applicant/Agency:**	Project Director (Digha & Kankarbagh Sewerage Project) BUIDCo.
2	**National Highway No.**	NH 30
3	**State**	Bihar
4	**Location**	Near Yogipur Nalla towards Nandlal Chapra
5	**Chainage in km**	186.935
6	**Length in m**	Jack Pushing - 103 Mtr.
7	**Width of available ROW on Both Slide**	
8	**Side of NH**	Left or right of NH towards increasing chain-age/Km direction
9	**Name of Highway Authority of MoRT&H/PWD/BRO**	MoRT&H
10	**Highway Administration address**	Executive Engineer PIU, Patna

ANNEXURE – C

Estimated cost to be paid by BUIDCo. To MoRT&H

1.	**NH Right of Way (m)**	**Crossing**
2.	**Dia of Carrier Pipe (mm)**	1200 mm DI Pipe
3	**Dia of Cashing Pipe (mm)**	1800 mm MS Pipe
4	**Dia of OFC (m)**	NIL
5	**Total Width of the utility**	1800 mm
6	**Utilized NH Land Area (Sq.m)**	185.4 Sqm
7	**Utilized NH Land Area (Decimal)**	1.891 Decimal
8	**Prevailing Land rate per decimal (Annexure I)**	Rs. 1397250
9	**Prevailing Land rate per sq. m**	Rs. 34534.11

As per MoRT&H, Circular no F. No. RW/NH-33044/29/2015/S&R Dated 22.11.2016

1	License Fees (Rs./Sqm./MoRT&H) = (Utilized NH Land Area * Prevailing Circular rate of land per unit area/(10*12)	Rs. 64,02,623/-
2	License fee for 5 years.	Rs. 541,383/-
3	License fee payable = 33% of calculated for public utilities (Point No.5 of the circular)	NA
4	Amount of Bank Guarantee to be furnished by BUIDCo., UD&HD for period of 1 Year (Point no 6 of the circular i.e. Rs 25,750/-)	Rs. 25,750/-

S No	Item	Measurement Observation as per Site Conditions	MoRT&H Norms	Whether complying with MoRT&H Norms
1	Details of already laid utility service, if any	No	Enclosed	
2	Whether up gradation of the Stretch in near future is proposed or not	No		
3	Laying of the utility service along the National Highways	No		
3.1	Location of proposed utility service along the stretch	As instructed by MorT&H	Utility Duct/beyond the Toe line of the embankment and drains, and close to the extreme edge of the Row.	
3.2	Depth of top utility service from ground level	NA	3.5 Mtr	
3.3	Mechanism for crossing water channel	NA	Trough utility duct (if provision exists) or beneath the bed of water channel	
3.4	Whether ROW is restricted in the stretch	No		
3.4.1	If yes, whether provision of land acquisition is required to lay utility.	NA		
	(a) If yes, whether undertaking for land acquisition along with relevant L.A details has been furnished.	NA		
3.4.2	Width of Concreate duct, if utility services are proposed to be laid in concrete ducts.	NA	Not less than one lane	
4	Laying of utility services across the NH	Yes		

4.1	Whether Existing drainage structures is allowed to carry the utility services.	No	Not to be allowed	
4.2	Proposed crossing of utility service		Perpendicular to NH	
4.3	Type of casing pipe/conduit carrying the utility line	MS Casing Pipe	Steel, Cast Iron, or reinforced cement concrete and have adequate strength	
4.4	Whether ends of the casing/conduit pipe are sealed from the outside.	Yes	Sealed	
4.5	Length of casing / conduit pipe crossing pipe	103*2=206 Mtr.	Extend from drain to drain in cuts and toe to toe of slope in the fills	
4.5.A	Length along with NH Service Lane	NA		
4.6	Depth of top of the casing/ conduit pipe	1.5 mtr	At least 1.2 m below the top of the sub grade	
4.7	Crossing method in case of CC pavements	Manual Jack Pushing	Only Boring method	
4.7.A	Laying method of NH service Lane			
4.8	Horizontal and vertical clearness in case utilities are allowed overhead.	NA	In accordance with IRC codes.	
5	Documents/Drawing enclosed with the proposal	Attached		
5.1	Cross-section showing the size of trench for open trenching method	NA	Enclosed, if applicable	
	(a) Trench Width	1.8 Mtr (Pipe OD-1.255 mtr)	More than 30 cm and less than 60 cm wider than the outer diameter of the utility pipe	
	(b) Filling of Trench	NA	As per Ministry Guidelines vide letter no RW/NH34044/29/2015/S&R	
	(a) Location of Trench	Enclosed	Extreme, if applicable	
5.2	Cross section showing the size of pit and location of the conduit of Jack Pushing method	Enclosed	Enclosed if applicable	
5.3	Strip plane/Route plan showing utility line, chainage, width of ROW, distance of proposed utility from the edge of ROW, important mile stone. Intersections, cross drainage works etc.	Enclosed	Enclosed	
5.4	Plane and profile drawing of stretch showing cross section of road at 20m distance along with ROW and proposed utility	Enclosed	Enclosed	
6	Method of laying of utility of utility line	Jack Pushing	Enclosed	

7	Draft license agreement is as per ministry guidelines vide letter NO RW/NH-34044/29/2015/S&R ® dated 22.11.2016 and signed by two witnesses			
8	License fees in Favor of MorT&H		Ministry's circular no. PAO/NH/Misc./2018-19/255-59 dated 19-08-2018	
9	Whether Bank Guarantees has obtained.		As per Ministry Guidelines vide letter no RW/NH-34044/29/2015/S&R	
	a). If yes, whether confirmation of BG has been obtained as per MoRTH/MORT&H guidelines			
10	Affidavit/undertaking from the applicant for			
10.1	Undertaking for not to damage other existing utility, if damage then to pay the losses to either to MoRTH/MORT&H or to the concern agency.	Enclosed		
10.2	Undertaking for renewal Bank Guarantees and when asked by MORTH/MOR&H	Enclosed		
10.3	Undertaking for shifting of utility as and when asked by MoRTH/MORT&H guideline	Enclosed		
10.4	Undertaking for indemnity against all damage and claims.	Enclosed		
10.6	Undertaking for management of traffic movement during laying of utility line without hampering the traffic	Enclosed		
10.7	Undertaking that if the Concessionaire/Contractors raise any claim then the same has to be paid by the applicant.	Enclosed		
10.8	Undertaking that the applicant has obtained various safety clearness from the represented authorities such as direction of Electricity, Chief controller of Explosives petroleum and explosive safety organization, Oil Industry Safety Directorate, State /Central Pollution Control Board and any other statutory clearance's applicable before applying to High way Administration	Enclosed		

The right of the Way (ROW) of the National Highway available at the proposed location from the center line of divided carriageway is 22m (from the center of ROW to edge of ROW towards proposed utility).

The above particulars along with the drawing and documents have been certified and certified as correct as per prevailing site conditions

The Executive Engineer
Digha & Kankarbagh Sewerage Project,
Buidco, Room no. 205 Rajapur Pul,
West Boring Canal Road
Patna, Bihar

Sir,

Sub: Development of Sewage Treatment Plants (STPs) & Sewerage networks for 15 years in Patna, State of Bihar – Recommended to approve the Revised methodology for trenchless piping by jack pushing method for Digha and Kankarbagh Sewerage Network. -reg.

Ref: 1. Concession Agreement dated 30.12.2019
2.WABAG/10P155N/260/23-24, dated-26-09-2023.
3.WABAG/10P155N/264/23-24, dated-27-09-2023.

With reference to the above subject, it is recommended to approve the Revised methodology for trenchless piping by jack pushing method.

This is for your perusal & further necessary action, please.

Thank you.

Digha & Kankarbagh Network Sewerage Project

Methodology for Trenchless Piping by Jack Pushing Method

Reference From: - IndSTT (Indian Society for Trenchless Technology)

1.0 Purpose:

The Purpose of this procedure is to lay guidelines, requirement and to establish a method or a system to control the open cutting & trenchless activity.

2.0 Scope:

The Scope of the works covers the laying of RCC Pipe NP4 of 1000mm, 1100mm, 1200mm, 1400mm & 1600mm dia on Digha & Kankarbagh Zone by using Trenchless Jack Pushing method.

3.0 Methodology:

3.1 Survey

Alignment of Pipe Line to be marked from the position of Manhole to Manhole which is to be constructed. Also enclosed Geo-Tech report along with this methodology showing the N Value of Soil Strata.

3.2 List of Manpower:

- Supervision Engineer -1
- Quality Engineer - 1
- Safety Officer -1
- Supervisor -1
- Excavator Operator -1
- Hydra Operator -1
- Welder -1 (for Strutting and shoring)
- Fitter -1 (for Strutting and shoring)
- Electrician -1
- Mechanic -1

- Rigger -As per Requirement
- Unskilled Labour - As per Requirement

3.2 List of Machinery:

- JCB / Excavator Machine - 1
- Tracker Machine -1
- DG Set -1
- Hydraulic Power Pack Machine for Jack Pushing -1
- Hydra -1
- Dewatering Pump 10HP -2
- Exhaust Fan -1
- Lighting Arrangement inside Pipe - As per Requirement

3.3 Procedure:

1. Underground Utilities to be checked with tracking machine before start of the work. If any Underground facility found, then it is to be informed to concern authority and change in alignment to be initiated and approved by the competent authority.

2. After checking with Tracking Machine and if there are no underground utilities or alignment approved, the marking of Manhole to be done on both ends and marking to be done on the ground for the underground piping.

3. Area to be properly barricaded with the steel barricading/ proper barricading and if diversion is to be made then the board of Diversion to be installed at both ends.

3. Entry Pit is to be excavated to the sufficient capacity so that RCC Pipe line of 2.5-meter length can be laid through this entry point by jack pushing method.

4. After Pit excavation the proper Strutting and Shoring to be done with Steel material

5. Inside the excavated pit, the RCC wall to be constructed on opposite direction of pipe pushing for support of jack resting.

6. Pushing of RCC Pipe to be started after that with Hydraulic Power Pack Machine from 100mm to 250mm and manually excavation of soil in pushing alignment with crow bar and pixels and disposal of soil outside of pit by the use of Hydra machine.

7. Activity of Pushing and Manual excavation inside of pipe to be done in tandem.

8. Arrangement of proper lighting and exhaust to be done for proper working inside of pipe line

8. Alignment & Level of pipe to be checked with Tracker Machine.

9. With the pushing and manual excavation method the pipe line to be laid up to the next manhole.

10. Then the RCC Wall made inside of the entry pit to be demolished.

11. Construction of Manhole as per the procedure to be done in the excavated entry pit.

12. Backfilling & road restoration will be done by other agency (RCD) and respective qty for the same has also been deposed from Wabag Contract.

13. By this way the work will go on from the entry point of next manhole.

14. Hydraulic testing of pipes as pes IS 3597 at every manhole to manhole.

4.1. ESHS Responsibilities: -

Site Engineers are frontline functionaries and they are accountable for safety and regulatory compliance in their function. Its includes

- Participating and implementation of site-specific HIRA/JSA.
- Responsible for the Implementation of OCPs.
- Providing daily 'Tool box Talk' and simulating high level of ESHS awareness at all times.
- Identification of high-risk work areas requiring permit to work system and ensuring the work only start after getting a work permit. **As per enclosed – A** Safety in confined spaces atmospheric hazards.
- Compliance to the applicable Acts, Rules, Regulation and Standards affecting occupational and safety.
- Contributing in implementing al ESHS requirements and ensuring that all works are performed in a manner, which is safe and without any risk to health & safety of staff & workmen.
- Participating in and adhere to all safety instruction, procedures and activities.

- Ensuring all the necessary controls are in place before start the work.
- Ensuring all the workers wear PPE as per job requirement.
- Providing advice and assistance on ESHS to all employee and subcontractors.
- Ensuring good housekeeping and rectify all the unsafe conditions at work place.
- Reporting & investigating all incidents and pay particular attention to those having caused injury to an employee.
- Supervising and ensuring compliance with safe work, procedures under permit system.
- Communicating with HSE engineer regarding the near miss, incident, and work related hazards of work being carried out.

4.2. ESHS Checklist: -

As a professional company we are assure that Sewerage Pipe Laying work by Manual Jack Pushing work carried out with below ESHS checklist

Checklist for Jack Pushing at Each Point		
S.No.	**Item Description**	**Availability as needed**
1	Engineer & Supervisor	All time at site
2	HSE Supervisor from Contractor	All time at every site
3	Labours required	Day 8nos and Night 8nos
4	Hydra loaded with ASLI	Day night alternative operator
5	Tractor	Day night alternative operator(with road permit)
6	Excavator	For Pit excavation & backfilling
7	Dewatering Pump	All time at site
8	Multi Gas detector	All time at site
9	Air Blower	All time at site
10	oxygen mask	All time at site
11	Ladder with Hand Rail	All time at site
12	DG set/Electric connection	All time at site
13	First aid kit	All time at site

Checklist for Jack Pushing at Each Point		
S.No.	Item Description	Availability as needed
14	Full safety Belt	All time at site
15	Life line rope with Full Body Harness (16mm)	All time at site
16	Shoring & shuttering as per required Depth	All time at site
17	Fire Extinguisher ABC type (5-Kg)	All time at site
18	SCBA - for oxygen	All time at site
19	Lifting belt - 10 ton	All time at site
20	Proper lighting arrangement	All time at site
21	Safety Helmet with light	All time at site
22	Mandatory PPE	All time at site
23	Job Specific PPE's	All time at site
24	Filter Cartridge Mask	All time at site
25	Traffic Marshall (Both Side)	All time at site
26	Safety Signage Board	All time at site
27	Road Safety Signage Board	All time at site
28	Industrial DB With ELCB/RCCB	All time at site
29	Legal Documents (JCB/Hydra)	All time at site
30	DL with Aadhaar Card	All time at site
31	Fitness certificate with Aadhaar ID	All time at site
32	TPI Certificate (Lifting Tools & Hydra)	All time at site
33	Blinker Light for night work	All time at site
34	24 Volt Light for Confined Space	All time at site
35	Flash Back Arrester (Both Side Hose Pipe)	All time at site
36	Oxygen & DA Cylinder With Trolley	All time at site
Note :-Total nos. of Hard Barricading Required as per Site.		

i). Enclosed B – CONFINED SPACES PERMIT TO WORK
ii). Enclosed C – RISK ASSESMENT SHEET.

For VA TECH WABAG LIMITED

(Project Manager)

Shashi Mohan Singh

SAFETY IN CONFINED SPACE

Objective:

Work in confined spaces presents a high risk for the health and safety of persons.

This procedure defines the minimum essential safety requirements of the Concessionaire for the intervention in a confined space.

It applies to all Confined space work sites

CONFINED SPACE

Essential modification(s):

- Procedure prepared by the Safety Department MACE

Associated documents:

- Safety in confined spaces – Permit to work

Contents:

1. DEFINITION 2
2. MAIN RISKS RELATING TO INTERVENTION IN A CONFINED SPACE 2
3. PREVENTING INVOLUNTARY ACCESS 6
4. INTERVENTION IN CONFINED SPACES 6
5. PROTECTIVE MEASURES 11
6. MONITORING AND ASSISTANCE TO ACCIDENT VICTIMS 14
7. ADDITIONAL INSTRUCTIONS ..... **ERROR! BOOKMARK NOT DEFINED.**

Definition

A confined space is a space that is completely or partially enclosed:

1. Which is not designed to be occupied by people, nor intended to do so, but which, when the need arises, may be occupied for the execution of work such as inspection, Trenchless Jack Pushing work, D-silting, maintenance or repair of pipeline, etc.

2. Which has limited means for entrance and exit. This could be a ladder or very long or very narrow stairs with a very steep slope. Any object or equipment may restrict access to the space or prevent air from circulating freely

3. Which may present risks for the safety of those who enter it, because of:
   - Its design, its construction or its location
   - Its atmosphere or insufficient natural or mechanical ventilation
   - Solids, liquids, gases and/or powdered material or substances that it contains or that can enter into it at any time
   - Other related dangers.

This is usually a location whose volume/opening dimension ratio is such that natural exchanges of the air inside with the outside atmosphere are non-existent, insufficient or uncontrollable.

The restriction in the movement of air may be due to:

- Either the narrowness of the location in relation to its length or depth.
- Or the closed nature of the place. Entrance is then from one or more openings, which may be of very small dimensions (manhole, for example), which increases the difficulties of access (enclosed confined space).

Examples of confined spaces: ditches, tanks, bins, chemical reactors, sewer manholes, narrow and long sewer pipeline or any other pipe line, channels, underground maintenance spaces, etc.

Main risks relating to intervention in a confined space

Confined spaces present environments that are particularly dangerous for the life and safety of workers. These risks are greatly increased by difficulties in evacuation and the risk of panic.

The majority of accidents are caused by an atmosphere with insufficient oxygen or a toxic environment (65% of deaths). Half the deaths are of those who attempt to rescue others (chain accidents).

Risks relating to the atmosphere

Asphyxia due to oxygen deficiency or an excess of other gases (CO_2, CO, CH_4, etc.)

Under-oxygenation of the air results from various causes:

- The consumption of oxygen by a combustion reaction (welding, fire, etc.), oxidation of a metal as well as breathing by the workers.
- Replacement of the oxygen by other gases during blow-down, seepage or inerting operations.

The air normally contains 21% of oxygen. Under-oxygenation represents a genuine danger to the life of a worker.

- At 16%: breathing difficulties, reduction in the judgement capacity, rapid exhaustion.
- At 12%: loss of consciousness and death in the absence of adequate response.
- At 6%: death in a few seconds.

Intoxication by inhalation or absorption of a gas or toxic product (H_2S, CO, etc.)

The accumulation of toxic substances is the source of serious intoxications, which can be fatal in the absence of adequate intervention.
Contamination of the air may result from the process, residual material (e.g. sewage residue, silt), work done (welding, cutting, grinding etc.), from outside the confined space (exhaust gases, etc.) or from chemical reactions between various products.
The most frequently encountered gases in sewer manholes, lines are hydrogen sulphide (H_2S), methane (CH_4), carbon monoxide (CO), carbon dioxide (CO_2)
The following tables list the general characteristics of the main dangerous gases as well as the most commonly accepted permissible exposure values.

Gas or vapour	Flammable	Physical description	Main risk	Permissible exposure value in air	Density (compared with air=1)
Chlorine (Cl_2)	No	Yellowish green colour; sharp odour	Toxic; severe irritant, pungent for the eyes and the respiratory tract	0.5 ppm	2.5
Carbon dioxide (CO_2)	No	Colourless, odourless	Displaces oxygen: toxic	5000 ppm	1.5

Gas or vapour	Flammable	Physical description	Main risk	Permissible exposure value in air	Density (compared with air=1)
Nitrogen dioxide (NO_2)	No	Reddish brown colour; sharp odour	Toxic; severe irritant for the respiratory tract	3 ppm	1.6
Sulphur dioxide (SO_2)	No	Colourless, suffocating odour	Toxic; severe irritant for the respiratory tract	2 ppm	2.2
Methane (CH_4)	Yes	Colourless, odourless	Fire and explosion	10 % of the L.E.L. Simple asphyxiant	0.6
Carbon monoxide (CO)	Yes	Colourless, odourless	Toxic; asphyxiant	35 ppm	0.97
Hydrogen sulphide (H_2S)	Yes	Colourless, rotten egg smell	Highly toxic; can cause pulmonary failure	10 ppm	1.2

H_2S: Colourless gas that smells like a rotten egg at low concentrations, odourless at high concentrations, heavier than air and irritates the eyes and the respiratory tract. Inhalation may cause pulmonary oedema and a delayed loss of consciousness. Limiting exposure value: 10 ppm.

Description	Concentration of H_2S (ppm)	Exposure time
Characteristics of hydrogen sulphide (H_2S)		
Mild odour (rotten egg smell)	5.0	-
Limiting exposure value	10	8 hours
Effects of exposure on humans		
Strong and unpleasant odour	25	-
Irritation of the eyes, coughing, loss of the sense of smell	100	2 to 5 minutes
Irritation of the trachea and strong irritation of the eyes	200 to 300	1 hour
Loss of consciousness and possible death	500 to 700	30 to 60 minutes
Rapid loss of consciousness, respiratory distress, death	700 to 1000	a few minutes

Description	Concentration of H_2S (ppm)	Exposure time
Almost immediate loss of consciousness, respiratory failure, death in a few minutes. Death may occur even when the victim is brought out in fresh air.	1000 to 2000	immediate

CH_4: Colourless gas, odourless and highly explosive.

CO: Colourless gas, odourless, flammable, lighter than air. A person over-exposed to this gas experiences humming, nausea, headache, drowsiness that may result in death, even at low concentrations. Chronic exposure may have undesirable effects on the nervous system and the cardiovascular system. Limiting exposure value: 35 ppm.

CO_2: Colourless, odourless gas, at high doses causes headache, vertigo, tachycardia with possible loss of consciousness. Limiting exposure value: 5000 ppm.

Explosions and fire due to the presence of flammable gases

Combustible gases, dusts and chemicals combined with poor ventilation may create explosive atmosphere. A spark due to any activity may then cause a fire or catastrophic explosions.

Physical risks

Electrocution

The risk of electrocution in a confined space during the use of electrical devices increases when:

- The confined space is so narrow that the worker is in contact with the walls of the space
- The confined space is a humid place, saturated with water vapour or containing water
- There are many metallic surfaces in the immediate environment (pipes, containers walls, etc.).

Work in a confined space with electrical devices such as hand tools increases the risk of electrocution caused by poor insulation of this equipment or a malfunction.

Other physical risks

There exist several physical risks that need to be considered when working in a confined space, such as:

- Fall or drowning that may be caused by the shape or contents of the confined space
- Difficult entrances and exits caused by the location or dimensions of the confined space
- Poor visibility due to lack of lighting or limited dimensions that can cause falls or sliding

- High or very low temperatures
- High noise, etc.

Preventing involuntary access

Many serious accidents result from disregarding dangers. Often, the victim is not aware of the risk he takes by entering a confined space.

In order to prevent any involuntary access to a confined space, the following measures are taken:

- Identify the confined spaces of the site and inform the personnel about them.
- Block access to the confined space by a adequate means (e.g. putting manhole cover, barricading along with open manhole, deputing security personnel etc.)
- Indicate the danger at the entrance to the confined space with the help of a permanent, fixed and perfectly visible sign.

Intervention in confined spaces

Preparing and organising the intervention

Inspection of a confined space requires a meticulous prevention procedure. Before any intervention, a detail **Work Method Statement shall be** prepared. It is aimed at providing a detail work methodology while analysing the consequences and possible risks of the intervention in the confined space.

- The description of work to be carried out. Only work provided for in the **Method Statement shall be** executed. If, during the intervention, other work is required or new risks are identified, another **Work Method Statement shall be** prepared.
- The selection of collective and personal means of protection, and particularly respiratory protection.
- The intervention strategy.
- Checking the availability of tools.
- The date, time and anticipated duration of the intervention.
- The names of workers, their qualification. Only authorised personnel are allowed to enter a confined space.
- The name of the supervisor and his qualification.
- Working instructions with preventive and protective measures:
  - The signalling and safety planning of the working area.
  - Atmosphere control (gas monitoring).
  - Confinement and blanketing of pipes.
  - Cleaning and blow-down
  - Ventilation.
  - Personal protective equipment.
  - Means of communication.
- The contingency plan and rescue measures.

Intervention authorisation in confined spaces

The authorisation to undertake work in confined spaces comes into effect after completion of:

1. The Work Method Statement
2. The work permits.

The intervention cannot begin if any one of the two documents is not signed.

The **Work Method Statement** shall be drawn up by the intervention manager. It is signed prior to the intervention by:

- The field engineer/ supervisor for implementing the intervention plan during execution of the activity.
- The **work permit** is to be prepared by the supervisor of the activity and approved by the field engineer.

The **work method statement** and the **work permit,** signed and originals, are available at all times at the work sites.

At any time, the intervention may be postponed or interrupted if the safety conditions are not or are no more respected.

Night interventions permission needs to be taken from client in advance.

The **work permits** need to file in PTW file at main office after completion of work.

Routine interventions

Periodic intervention in a confined space for a routine activity may lead to, due to habit, a relaxation in vigilance. A false sense of safety may then become prevalent among intervention teams. This procedure therefore applies without any exceptions.

Authorisation of personnel and training

Authorisation is the recognition by the employer of the ability of an employee to safely carry out activities presenting occupational hazards for him or for the environment at a given structure for a limited duration.

This authorisation is valid for a defined period not exceeding two years.

Personnel that need to intervene in a confined space have to be mandatorily authorised by their hierarchical superior. This authorisation consists in:

- Ensuring their physical and psychological ability by subjecting them to a prior health inspection. The health inspection needs to be planned on bi- annual basis.

- Training for risks relating to their activity, protective measures, the use of personal protective devices, operating procedures, safety precautions, rescue and first aid instructions.

This training is preferably given by an external agency. It includes at least the following points:

- Procedure
- Risks generated by the intervention
- Use of fall-arresting devices (safety harness, etc.)
- Use of life line
- Use of a multi gas detector.
- Use of a self-contained breathing apparatus
- Use of a emergency escape breathing apparatus.
- Rescue procedures and means.

Equipment

The personnel intervening in a confined space are mandatorily equipped with working and protective equipment. They use signalling equipment and means of communication that enable them to work in safety.

The **Work Method Statements shall** identify the list of equipment to be used during the intervention.

These equipment items are regularly checked.

The personnel are trained in their use.

Personal and collective protective equipment:

- Atmospheric controller (multi gas detector) shall carry by the person who is going first inside the confined space & leading the crew only after ensuring that all gases concentrations are within a permissible limit before entry.
- Blowers
- Fall-arresting device (safety harness for each entrants)
- Emergency escape breathing apparatus (20 minutes' duration) for each entrants.
- Adequate access / egress
- Life line must be attached to the individual safety harness at all times during their work. The only exception is if there is a danger of entanglement (i.e. more than three workers inside the pipe at the same time) in which case each worker may disconnect his safety rope at the bottom of the manhole (all ropes must remain at the bottom of the manhole) Safety harnesses are to be worn at all times while working in confined space.
- Safety Helmet, Gumboots/safety shoes, Hand gloves, working clothes, safety glasses
- ATEX proof 24 V electrical lamp

- Lifejacket when there is a possibility of drowning
- Non sparking tools
- First aid kit and equipment(Emergency vehicle)

NOTE: Precautions regarding use of portable electric light:

No portable electric light or any other electric appliance of voltage exceeding 24 volts shall be used inside any chamber, tank, sewer manhole, pipeline or other confined space.

- If any flammable gas, fume or dust is likely to be present in any chamber, tank, sewer manhole, pipeline or other confined space no lamp or light other than that of flame proof construction shall be used therein.

Other protective equipment may be used depending on other risks identified.

Signalling equipment

- Signalling cone markers
- Flash lights
- Manhole guard and shield.

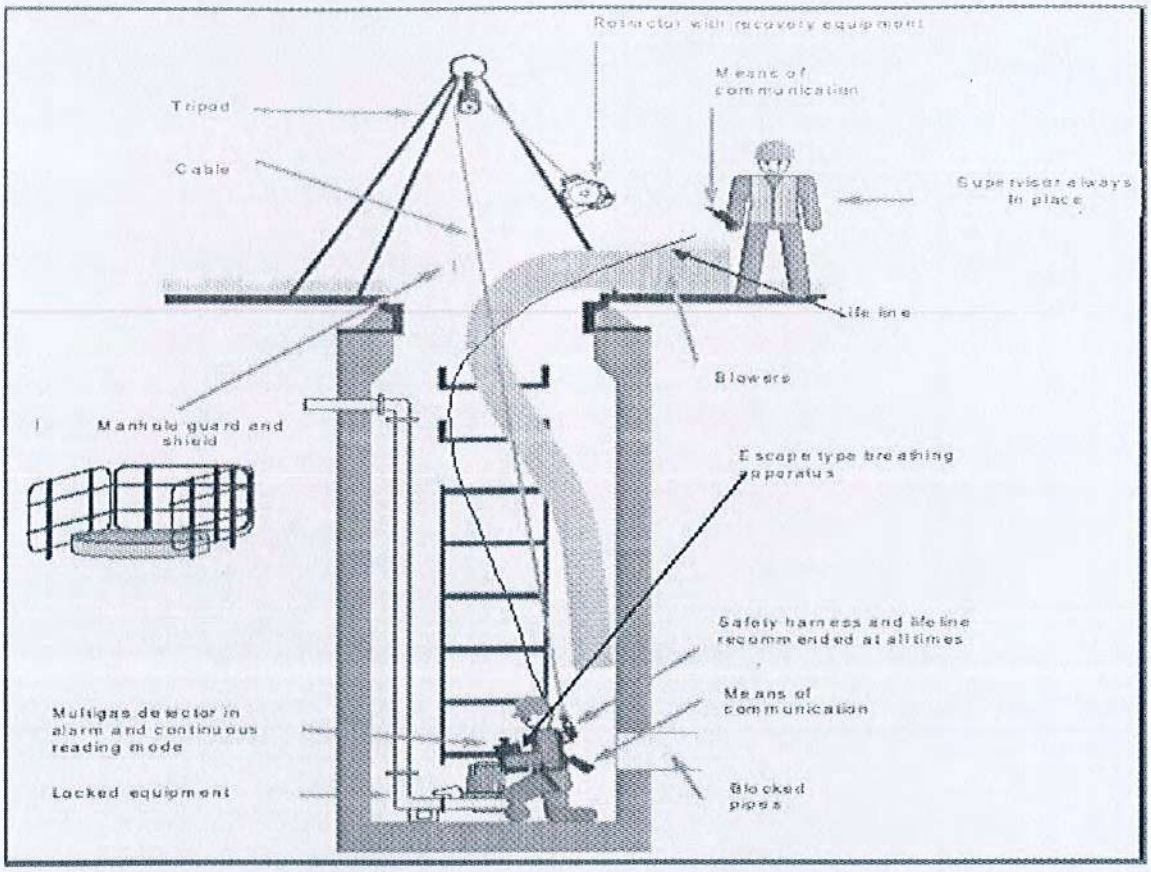
Means of communication

- Two-way radio, cellular telephone if there is no visual contact between the interveners and the supervisor.

It must be noted that the use of explosion-proof equipment is mandatory in ATEX zones and in confined spaces that may contain flammable substances (dust, CO, H_2S, CH_4, etc.). Therefore, cellular telephones are prohibited in ATEX zones.

These lists are not restrictive. The list of equipment depends on the nature of the intervention. This list needs to be made during the intervention preparation phase (**intervention plan**).

Filter canister masks are strictly prohibited.
Self-contained breathing apparatus is allowed only in rescue operation



Intervention

Several steps have to be mandatorily followed:

1. Obtaining the signed Work Method Statement and the **work permit**
2. Checking the authorisation personnel availability.
3. Making sure that every member of the intervening team is acquainted with and has understood the **Work Method Statement**.
4. Verifying the availability of equipment.
5. Ensuring the deployment of experienced & trained supervisor.
6. Providing assistance and first aid.
7. Setting up signalling (marking) and determining the safety perimeter of the working area.
8. Checking the confinement and blanketing of pipes necessary for securing the working area.
9. Checking the required personal protective equipment.
10. Ventilating the confined space and maintaining it till the last intervener has left the area.
11. Checking the gas risk in the confined space. Monitoring the atmosphere inside the confined space.

The work permit is used and filled-in by the supervisor during the entire duration of the intervention. The following elements are written down:

- Checks to be carried out
- Analyses of the atmosphere in the confined space
- Information on the ventilation system
- Emergency procedures
- Various comments
- The timing of major events.

It is signed by the intervention manager, the supervisor and all the interveners at the end of the operations

Once all the work is complete, the intervention ends only after all interveners and equipment have been evacuated from the confined space.

Protective measures

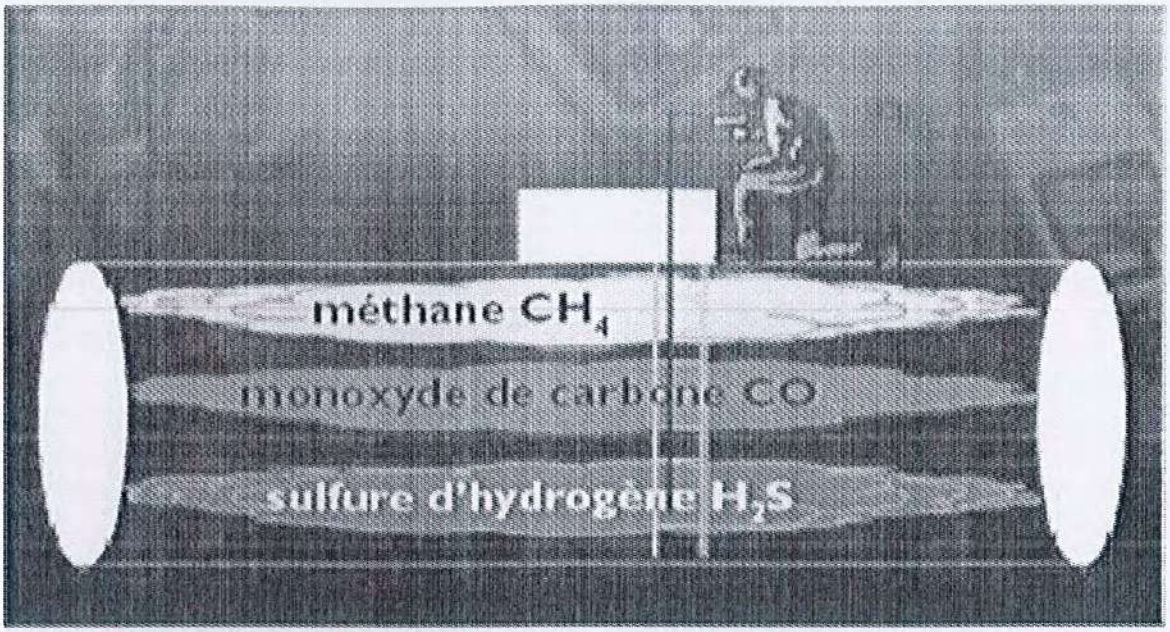
Monitoring the atmosphere requires detection of gases and ventilation of the confined space.

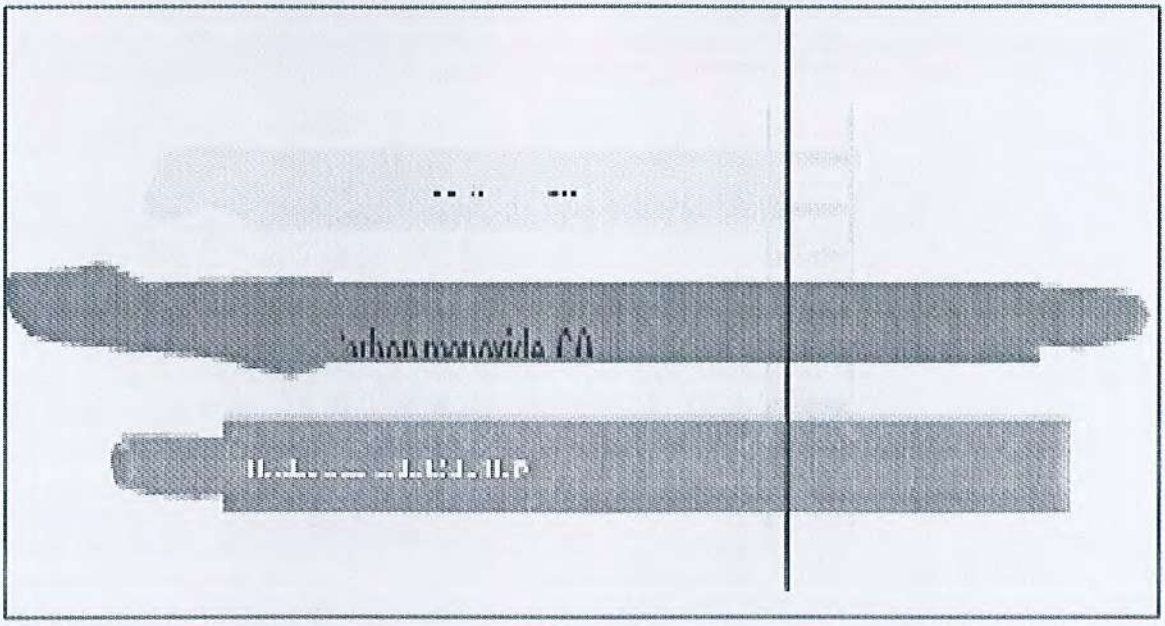
Gas detection

Gas detection is a critical phase for the safety of interveners. Three types of checks are done:

1. Explosion hazard
2. Toxic hazard.
3. concentration of oxygen

Assessment of the atmosphere is done by a qualified person, trained in the use of measurement devices and the interpretation of results.
Direct reading instruments are strongly recommended. They are intrinsic to safety when they are used inside the confined space.
The audible warning device must be heard even in a noisy environment. A vibrating device and indicator lamp in addition to the audible warning device are preferable.
Gas detectors are maintained, calibrated and checked regularly in accordance with the manufacturer's instructions.
Before every entry into a confined space, measurements are made with a device equipped with a sensor and an electric or manual pump, to take remote measurements, if required.
Depending on their density, gases may be found at different levels in the confined space. Methane, lighter than air, is concentrated in the upper portion, whereas hydrogen sulphide and carbon monoxide, which are heavier than air, may be found at the bottom instead. It is therefore necessary to make sure that the sensor is lowered at different levels to cover all the area.





The values to be measured are defined in the Work Permit. The following measurements are always mandatory:

- The oxygen concentration
- The explosive limit of gases and flammable or combustible vapours
- Concentration of toxic substances that may be found in the confined space.

These measurements are recorded on the work permit, and they are compared with the acceptable limiting values.
Once inside, the device is in streaming mode. It then provides the concentration of gases and oxygen in its immediate environment. Note, different concentrations may be found nearby. Exceeding the threshold triggers an immediate evacuation.

Cleaning and blow-down

Cleaning and blow-down are preparatory operations prior to entry into the confined space. As far as possible, cleaning and discharge of residues are done from outside, without entering the confined space.
It is prohibited to stick one's head into an opening of the confined space in order to take a look inside.
Water draining helps replace a dangerous atmosphere.

Ventilation

Ventilation increases the level of safety, dilutes the contaminants that may be present and undetected. It brings in oxygen.
Only continuous mechanical ventilation helps control a dangerous atmosphere; natural ventilation cannot be relied upon as air movements are unpredictable.
Before entering into it, the confined space is ventilated. The ventilation is maintained up to the end of the intervention and the exit of the last intervener.
Dilution ventilation consists in changing the air of the confined space. A ventilation system that pushes in fresh air into the confined space is used. Air inlets are located opposite the air outlets and at a place that is furthest from these. The fresh air inlet is kept away from sources of contamination.

We recommend:

- 7 changes of the air volume before entering.
- 20 changes of the air volume per hour, during the intervention.

The mode of ventilation depends on the nature and physical properties of the hazardous atmosphere.

Respiratory protection

Entry into a confined space is strictly prohibited if the conditions are abnormal even after draining, cleaning, blow-down and ventilation of the space.
As a result, permanent respiratory protection is normally not required.
However, every intervener takes along with him an emergency escape breathing apparatus while entering into confined spaces.
The emergency escape breathing apparatus is a respiratory protection with an internal provision for breathable air with a limited operation duration of about 15 to 20 minutes generally, enough for

leaving the enclosure in case toxic or flammable gases are detected, or in case of oxygen deficiency. It completely isolates the person wearing it from the atmosphere around.

The emergency escape breathing apparatus is not designed for normal work but is meant only for evacuation.

Its periodic verification is essential in order to ensure protection in case of need.
It must be recalled that:

- Filter canister masks are strictly prohibited. They do not provide protection against strong concentration of toxic gases and in case of oxygen deficiency
- Self-contained breathing apparatus is allowed for special operations (rescue & diving) that require wearing of this special respiratory protection.

Confinement and blanketing of pipes

Before the intervention, all energy sources like electrical, mechanical, hydraulic, chemical (sewage flow), thermal, pneumatic, etc., is isolated.
Confinement helps securely freeze a situation so that no modification is possible without the voluntary action of all interveners. In this regard confinement procedure preferred.
The blanking of pipes helps protect the interveners against a sudden inlet of hazardous substances. The pipes are disconnected, plugged or blocked.

Monitoring and assistance to accident victims

When a person is exposed to an oxygen deficiency or a toxic atmosphere, we have only a few minutes to respond before the consequences for the victim become irreversible or fatal.

It is therefore crucial to ascertain the difficulties as soon as they occur.

Continuous monitoring of the intervention is therefore mandatory.

The following are the supervision tasks:

- Observe those who enter the confined space
- Call in the rescuers as soon as the entrants have difficulties (when they require external assistance)
- Observe the working conditions inside the confined space
- Observe the external conditions that could influence the working conditions inside the confined space
- Supervise the proper operation of the ventilation
- Call the entrants so that they may leave the confined space when anomalies that could lead to a hazardous working environment are observed or when the working environment becomes hazardous.
- Supervise access so that unauthorised persons may not enter the confined space

- Check if the entrants are wearing suitable personal protective equipment.

Supervision is done by a specially designated person. This supervisor does not undertake any other task that could affect the supervision. He is suitably trained to execute his task.

The supervisor remains outside. He is in constant contact with the entrants. Direct visual contact is accorded priority. In case this is not possible, other suitable means may be used (radio equipment, or one person should stand at the bottom of manhole and others can go inside the pipeline so that he can act as a communicator between attendant and entrant for example).

He has means to call in the rescuers immediately from the place of supervision.
If the conditions necessary for safe work cannot be respected any more, the personnel must evacuate the confined space. This may be because of:

- A malfunction of the ventilation
- Measurement of a concentration beyond the permissible level etc

Panic and ignorance of the instructions and procedures to be followed are factors that aggravate an emergency situation.

An **emergency plan** for the specific risk of work in confined spaces is prepared as a preventive measure for each site. Its purpose is to give the personnel instructions to be followed in case of an accident or an alarm.

The **emergency plan** defines the instructions and emergency measures adapted to the sudden occurrence of a serious accident or an emergency. It specifies, in particular:

- Internal rescue measures
- First aid and medical assistance to be provided to victims
- Immediate measures to:
  - Control, combat and/or contain the dangerous situation
  - Avoid aggravating the situation
  - Protect the personnel, neighbouring populations and the environment
  - Safeguard the facilities and assets
- Evacuation of victims.

The intervention manager and the supervisor must acquaint themselves with the **emergency plan** before the start of the intervention.

CS 01.01 RISK ASSESSMENT SHEET

Identification of the confined space: **Location:**

1. Entrances and exits

Is the entrance mandatory? Alternatives:

At what frequency?

Depth: Volume: Number of divisions:

Number of entrances: Dimension of entrances:

Position of the main entrance:

Equipement required to access and evacuate:

Equipement required for rescue:

Fall-prevention devices required:

Signalling required:

Measures taken to prevent the entry of an unauthorised person:

Does the design of the confined space present specific risks? (sketch overleaf if required)

a) For the workers

b) For the rescuer

2. Isolation of equipment and plugging of pipes

Identification of the equipment	**Type of energy**	**Items to be isolated or plugged**
1)		
2)		
3)		

All energies (electrical, mechanical, hydraulic, chemical, thermal, pneumatic, etc, potential or residual) must be removed, isolated and/or dissipated so as not to endanger the safety of personnel.

3. Assessment of the atmosphere

Contents of the confined space:

Atmosphere: ☐ Flammable or combustible >= 10% ☐ Irritant ☐ Oxygen < 19%

☐ Toxic gas ☐ Dust ☐ Oxygen > 23%

Specific contaminant to be detected:

Must the confined space be emptied? Must it be cleaned? Must it be drained?

Other comments

General ventilation required

Natural ventilation flow: Flow of the required dilution ventilation:

Number, type, capacity and position of fans required:

4. Work to be carried out

☐ Hot working Welding and cutting permit require ☐ yes ☐ no

Chemicals used	**Equipment and tools used**
1)	1)
2)	2)
3)	3)

Local ventilation required

Flow of the exhaust ventilation required:

Number, type, capacity and position of fans required:

5. Other hazards

Mechanical hazards			**Biological hazards**		**Others**
☐ Fall	☐ Drowning		☐ Wastewater	☐ Sediments	
☐ Projections	☐ Noise		☐ Bioaerosols	☐ Dust	
☐ Free flowing material	☐ Equipment		☐ Mildew	☐ Rodents	

6. Protective equipment required

☐ Self-rescue gas mask	☐ Goggles	☐ Protective footwear	☐ Gas detector	
☐ Respiratory protection	☐ Gloves	☐ Safety boots	☐ Explosion-proof light	
☐ Safety harness	☐ Life line	☐ Fall-arresting device		
☐	☐	☐		
☐	☐	☐		

DO NOT DESTROY THIS PERMIT AFTER CANCELLATION / COMPLITATION THIS ENTRY PERMIT MUST BE RETAINED BY EMPLOYER FOR AT LEAST TWO YEAR

9. Test(s) To Be Taken	Permissible Entry Levels	Test 1	Test 2	Test 3	Test 4
A. Percent of Oxygen (O2)	19.5% to 23.5%				
B. Combustible Gas	10% LEL				
C. Hydrogen Sulphide (H2S)	10 PPM
